Focused Tissue Stimulation Combined With Biofeedback

(((ONDAMED®)))

a better way to make you better

INTRODUCTION

Over the past 50 years, scientists and engineers have developed biophysical diagnostic tools including EEG, EKG, X-Ray, CT scans, and MRI. ONDAMED® Technology provides therapeutic intervention based on biophysical mechanism of action employing focused pulsed electromagnetic fields.

HOW DOES ONDAMED WORK?

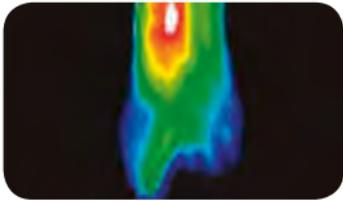

- A personalized Biofeedback method allows the practitioner to detect physiological weakness including inflammation, scars or unresolved emotional trauma.
- ONDAMED® induces vector driven microcurrents in tissue, thereby stimulating local metabolism exchange and attracting immune response to areas where applicators are placed; thus aiding the body's biochemical process for repair and regeneration.

PROCEDURES

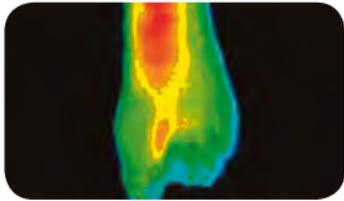

1. Patient sits or reclines comfortably in a chair, fully clothed, and a session typically takes about 30 minutes.
2. Practitioner palpates the radial pulse while offering therapeutic stimulation emitted from applicators to identify most therapeutic focused electro magnetic fields followed by locating dysfunctional areas related to patients pain such as inflammation or infection.
3. Applicators are placed on isolated reaction areas for targeted therapy.

Indication of use application:

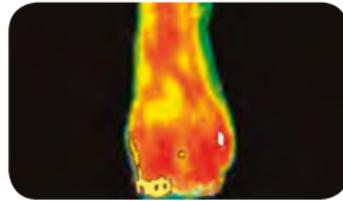

- Pain Relief
- Wound Healing
- Treatment of soft tissue injuries

Before ONDAMED®

After the first treatment

After the second treatment

Pain

OS, is a 49 year-old physician who suffered from acute pain in his left wrist in 2004. He injured his hand as he over-worked it in his daily practice. The pain caused him to stop working for 3 months, relying on ice and rest to treat the symptom. He received ONDAMED® treatment in July 2004. After his first ONDAMED® treatment, he reported the pain completely resolved the next morning. He went back to work and has not experienced any pain in the wrist since this one treatment.

The ONDAMED® Technology

Pain (Muscular)

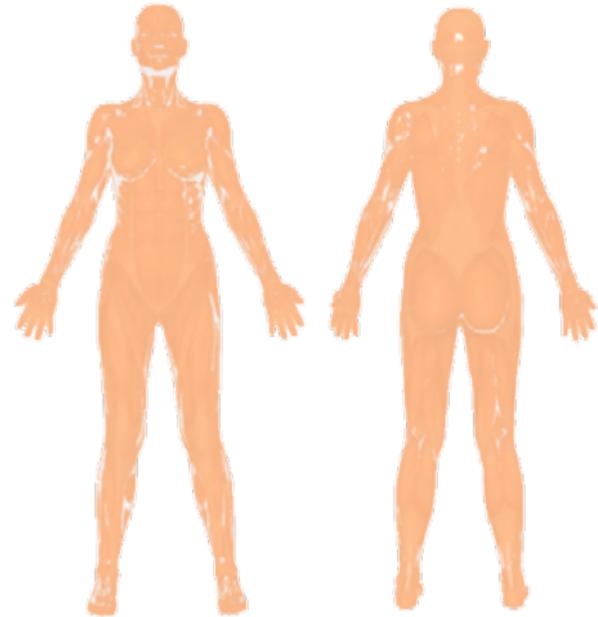

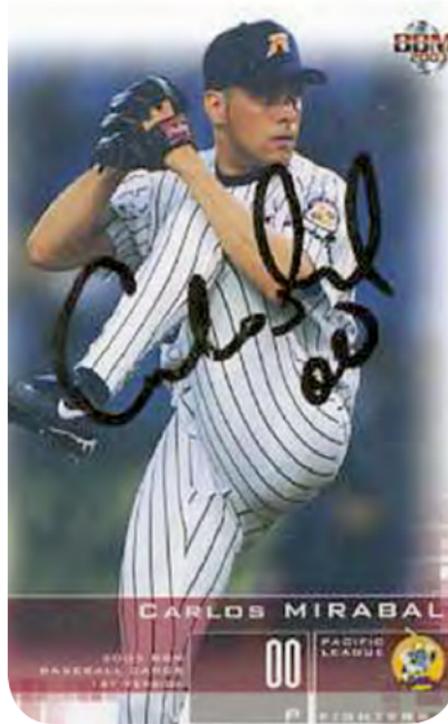

MM is a 36 year old woman who, in May 2006, had experienced severe right and left calf muscle pains after running. Her injury was probably caused by her not warming up enough before her run and must have pulled muscles in both legs to the point of hardly being able to walk. Immediately after receiving one ONDAMED® treatment the day after the injury, MM's condition was half-way to normal and she was able to walk. After one hour of treatment, she was completely pain free. The pain did not recur since then.

Sport Injuries: Rotator Cuff Injury

Carlos Mirabal, a 37 year-old retired Yankee pitcher was diagnosed with a Rotator Cuff tear while playing for the Yankees in 2006. Carlos was never able to return as a starting pitcher. The pain became chronic, forcing him to retire in 2008. ONDAMED® was started on June 28, 2010.

After 6 sessions with ONDAMED®, Carlos was able to move his shoulder with more range, could do more bench-pressing and lifting more weight. He no longer experienced pain in his shoulder or discomfort after the workout. Carlos started to slowly increase his training.

After 2 months of treatment, he was pitching again for major league teams without pain or discomfort.
